CENTRIFUGAL BRAKING SYSTEM

This patented Centrifugal Braking System is completely self-contained. The brake is locked within a containment housing and is energized by hydraulic pressure. The system is shipped with 8 brakes on or "engaged" providing maximum braking when the unit is turned on. This braking system is designed to automatically cut off brake energy when the reel is turned off. The brake system can be easily locked or "disengaged", for optimal performance. The brake weight must be set in opposing pairs on the "Engaged" side of the frame. The brake weights are engaged by hydraulic pressure.

1. All 8 brake weights engaged.

2. Four brake weights engaged.

3. Two brake weights engaged.

4. All brake weights disengaged.

The possible combinations are as follows:

1. All 8 brake weights engaged.

2. Four brake weights engaged.

3. Two brake weights engaged.

4. All brake weights disengaged.

Maximum braking is obtained when all 8 brake weights are engaged. The "Engaged" side can be adjusted to maximize your casting distance.
